ENDA EPV542 series voltmeters are rail mounted devices. Make sure that the device is used only for intended purpose. The electrical connections must be carried out by a qualified staff and must be according to the relevant locally applicable regulations. During an installation, all of the cables that are connected to the device must be free of electrical power. The device must be protected against inadmissible humidity, vibrations, severe soiling. Make sure that the operation temperature is not exceeded. The cables should not be close to the power cables or components.

If ItYP input type "500" is selected, the measurement terminals **1** and **4** of the terminals must be connected. Otherwise, measurement will be incorrect.

If ItYP input type " 100" is selected, the measurement terminals **2** and **3** of the terminals must be connected. Otherwise, measurement will be incorrect.

Increment Key & Keylock	(▲)	Used for increasing the setpoint value and changing parameters. When held down for a few seconds, configured numeric value increases faster. In "Runnig Mode", pressed for 3 seconds continuously, activates or deactivates keylock.
Decrement Key	(▼)	Used for decreasing the setpoint value and changing parameters. When held down for a few seconds, configured numeric value decreases faster.
Programming Key	SET	Used for displaying and configuring the selected parameter value.

SETTING UP THE PARAMETERS

SET → tYPE → ▼ → dC → ▲ → ACdC → SET

If SET key is pressed, the current value of the parameter appears by flashing on the display.

▲ ▼ By using "UP" or "DOWN" navigation keys, selected parameter can be adjusted to the desired value.

SET After the setting up the parameters, if set key is pressed again, adjusted parameter name appears on display.

▲ & ▼ If these keys are pressed and held for 3 seconds, "Programming Mode" is entered or it returns to "Running Mode". If ▼ and ▲ keys are pressed while parameter names are displayed, than it returns to measured value.

***** Coil and Discrete input parameters are not available in the devices those have no relay
Note 1 : oEYP menu parameters can be used as “Holding Register” or “Coil.
Note 2 : Received "ModBus input register value" is multiplying by 1000 (based on dPnt) and mV value reached.
For example ;
if modbus value is 2842, (for dPnt = 2 (0.00)) 28.42x1000 = 28420 mV, ie 28.42V
if modbus value is 2842, (for dPnt = 3 (0.000)) 2.842x1000 = 2842 mV, ie 2.842V
Note 3 : UPLL and LoLL value should be written and read in 2 bytes. Calculations in the input register is also valid for that value.
For example ; Read value (for UPLL) is 150200 and if dPnt = 1 , this value is actually (150.2).
It is, 150200d (24A88h) ; LSW = 4A88h , MSW = 0002h.
